

The connection of Science and Policy

Tools

- Nudging, meaning you unconsciously convince people to act in favour of the environment, e.g. to use public transport or a bike for the way to work
- Environmental education and information, which can lead to a stronger demand of more environmental friendly products or a request for better air quality from the public
- Incentives like subsidising the purchase of bicycles for deliveryman or new cars with less or no emissions
- Legal requirements, new regulations which reflect the state of the art of pollution prevention
